

# World Geography

Geography is the study of places and the relationships between people and their environments. Geographers explore both the physical properties of Earth's surface and the human societies spread across it. When we study Geography at world scale, it is called 'world Geography'.

## Atmosphere

- The **vast expanse of air**, which envelops the earth all around is called the atmosphere. It extends to thousands of kilometres.
- It protects the Earth's surface from the Sun's harmful ultraviolet rays.
- It also regulates temperature, preventing the Earth from becoming too hot or too cold.
- The major constituents of air in the atmosphere are Nitrogen (78%), Oxygen (21%), Argon (0.93%) and Carbon dioxide (0.03 %).
- Besides water vapour, dust particles, smoke, salts and other impurities are present in air in varying quantities.

Layer	Height (km)	Feature
Troposphere	0-18 km	Contains 75% of the gases in the atmosphere. As height increases temperature decreases (about 6.5°C/km ascent).
Stratosphere	18-50 km	This layer contains the ozone layer. The temperature remains fairly constant. At upper layer temperature is almost 0°C.
Mesosphere	50-80 km	This is the coldest region of the atmosphere. The temperature drops to about -100°C.
Ionosphere	80-600 km	Radio waves are bounced off the ions and reflect waves back to the Earth. This generally helps radio communication.
Exosphere	Above 600 km	Upper part of exosphere is called Magnetosphere. The temperature keeps on rising constantly at high rate.
