A spring mass system (mass  $m$ , spring constant  $k$  and natural length  $l$ ) rests in equilibrium on a horizontal disc. The free end of the spring is fixed at the centre of the disc. If the disc together with spring mass system, rotates about its axis with an angular velocity  $\omega$ , ( $k \gg m\omega^2$ ) the relative change in the length of the spring is best given by the option

The figure shows a rod which starts rotating with angular acceleration  $\alpha$  about vertical axis passing through one of its end (A) in horizontal plane. A bead of mass  $m$  just fits the rod and is situated at a distance ' $r$ ' from end A. Friction exists between rod and the bead with coefficient  $\mu$ . Friction force acting on bead at time  $t$  ( $< t_0$ ) is given by

(b)  $mr(\alpha t)^2$

(c)  $m\mu\sqrt{g^2 + (r\alpha)^2}$

(d)  $\mu m\sqrt{g^2 + r^2(\alpha t)^4}$
